

Objets peints avec de la peinture look béton

v14453

Le béton pour créatifs donne une apparence lourde et solide à tous types de surfaces, et vous pouvez voir ici son effet sur une brique de lait et sur un boule en polystyrène.

Comment faire

1 Stir the concrete paste well and paint or spread over in a thin layer (as a base) on the object. Here we've used a polystyrene ball. Leave to dry.

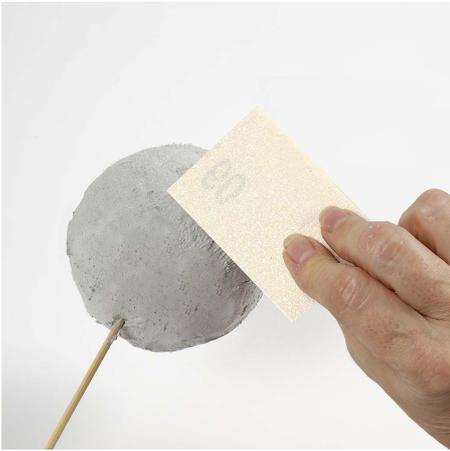

2 Apply a second layer of concrete paste to the object, in the thickness required to get the desired surface texture.

3 After drying for a few minutes, dab the surface evenly with a sponge on the still-wet concrete paste. Leave to dry.

4 Rub the surface with sandpaper to smooth it down (or leave in the desired texture). Brush off any dust.

5 Using a sponge, dab on the dark glaze onto the object. (This glaze is a paint which creates an underlying layer in between). Leave the object to dry.

6 In the same way as above, now apply the light glaze to the object.

TIP! Concrete paste can be used on all sorts of materials such as glass, porcelain and papier mâché. For example, make a flower pot out of an old milk or juice carton, as shown here.
